

# Per-pixel sequencing

Kellen Dye

## Four hybridization cycles

## Registration: RANSAC with SURF

# General stain

## Registration: Coherent Point Drift

## Preprocessing: top-hat filter

## Per-pixel sequencing

$$seq(x, y) = \underset{\substack{c \in \\ \{1, 2, 3, 4\}}}{\parallel} \underset{\substack{b_c \in \\ \{A, C, T, G\}}}{argmax} I_{b_c}(x, y)$$

## Per-pixel sequencing

## Quality for sequence

$$quality(x, y) = \min_{\substack{c \in \\ \{1,2,3,4\}}} \frac{\max_{\substack{b_c \in \\ \{A,C,T,G\}}} I_{b_c}(x, y)}{\sum_{\substack{b_c \in \\ \{A,C,T,G\}}} I_{b_c}(x, y)}$$

## Quality for sequence

# Quality for sequence

## Average intensity for sequence

$$avg(x, y) = \frac{1}{|c|} \sum_{\substack{b_c \in \\ seq(x, y)}} I_{b_c}(x, y)$$

## Average intensity for sequence

# Average intensity for sequence

## Maximum intensity for sequence

$$\mathit{maxIntensity}(x, y) = \max_{\substack{b_c \in \\ \mathit{seq}(x, y)}} I_{b_c}(x, y)$$

## Maximum intensity for sequence

# Maximum intensity for sequence

## Region size: lower threshold

## Region size: upper threshold

## Exclude

A priori known error sequences: AAAA, CCCC, GGGG, TTTT

Regions outside an inclusive binary threshold of the general stain

$$\text{avg}(x, y) < 25$$

$$\text{maxIntensity}(x, y) < 40$$

$$\text{quality}(x, y) < 0.475$$

$$\text{size} > 80$$

$$\text{size} < 5$$

Exclude

# Comparison with existing blob-based approach

## Comparison with existing blob-based approach

**Potential speedup**

**Just use connected components**

Not *that many* touching blobs of the same class

## **Potential improvement**

**Larger overlap for each imaging position**

Use regional information for registration of the general stain

**Potential improvement**

**Fully rigid registration**

Both RANSAC and Coherent Point Drift are affine

Scaling and shear mostly introduce error

**Thanks!**
